

ERRATA OF *INTRODUCTION TO TOPOLOGY IN AND VIA LOGIC*

CHAPTER 2

- **Exercise 2.7.** The definition of $T(A)$ is:

$$T(A) = \{s \in \omega^\omega : s \triangleleft a \text{ for some } a \in A\}.$$

CHAPTER 3

- **Exercise 3.4.** The real numbers a and b should be required to satisfy $a < b$.
- **Exercise 3.7.** An *interior map* is a map that is continuous and open.
- **Exercise 3.9.** In (3), the map f should be required to respect \sim , that is, for any $x, x' \in X$, $x \sim x'$ implies $f(x) = f(x')$.
